Every ship in your fleet has a purpose, and none are better suited for warfare than the Cutlass. No Man's Sky: What is the difference between BHC and OHC? I want to run my motorcycle. What is the difference between BHC and OHC? What do they mean? A: "B" stands for Bore, and refers to the diameter of the cylinder; "H" stands for "High" and refers to the compression ratio. On the Harley you need a "high compression" (HC) engine, while the larger Ducati motorcycles require an "intercooled", "high-compression" (BHC) engine. This is because with larger engines, achieving the same torque output requires a smaller overlap between the intake and exhaust valve openings, and thus more, powerful, cylinders. A: "B" stands for bore and refers to the diameter of the cylinder. "H" stands for High. This refers to the compression ratio. The high compression ratios require high displacement engines and since burette and crankcase pressures are related inversely, a tall engine with an integral fairing and high power output will have a burette or crankcase pressure high enough to potentially cause a negative pressure situation in the fairing. "C" stands for Compression ratio and refers to the ratio of cylinder bore size to stroke length. The performance improvements with the higher compression ratios increase the engine velocity to RPM ratio.
